<b>3</b>	<b>First Results</b>	<b>2</b>
3.1	Prices Evolutions . . . . .	2
3.2	Calculating Returns . . . . .	3
3.3	Squared Returns . . . . .	3
<b>4</b>	<b>Amazon and the 8 Stylized Facts</b>	<b>3</b>
4.1	Prices are non-stationary . . . . .	3
<b>A</b>	<b>Appendix: Python Code</b>	<b>3</b>

## 1 Introduction

For the midterm assignment, we composed a group of 4 with Gavini Charles; Fournier Justin; Prat Paul and Blanc Mathieu. This document contains all the results of our assignment, including tables, figures, and calculations. It is composed by 1 parts, first, importing the good python libraries, then initialising variables to separate the differents datas (daily, monthly, ..., returns, logreturns,...)

## 2 Preliminary

### 2.1 AMAZON

The chosen stock is Amazon, because it is higly related in the current actuality. We are very interested in a major company such as Amazon, which has grown significantly over time. The ticker from yahoo finance is " **AMZN** " on the Nasdaq stock exchange [AMAZON on Yahoo Finance](#) First, importing the Amazon stock with yfinance, then display the pandas table. We will import 25 years, 8 months and 25 days of data (from 1999-01-21 to 2024-10-16).

### 2.2 Data Table

The data printed here, is the preview of the Amazon stock extraction from yahoo fiannce:

Price Ticker Date	Adj Close AMZN	Close AMZN	High AMZN	Low AMZN	Open AMZN	Volume AMZN
1999-01-21 00:00:00+00:00	2.650000	2.650000	2.759375	2.314063	2.612500	940964000
1999-01-22 00:00:00+00:00	3.075000	3.075000	3.146875	2.468750	2.487500	875316000
1999-01-25 00:00:00+00:00	2.809375	2.809375	3.084375	2.750000	3.037500	546476000
1999-01-26 00:00:00+00:00	2.877344	2.877344	3.031250	2.765625	2.815625	490696000
1999-01-27 00:00:00+00:00	3.140625	3.140625	3.493750	3.000000	3.353125	700452000

Table 1: Preview of Amazon Stock Data from Yahoo Finance

## 2.3 Checking the 25 Years range condition

We have to check that the data is correctly displayed over a 25years range, hopefully, the introduction from Amazon is from january 1999, so it we should be able to find a 25 year range of data of the Amazon stock. To check that we can compute a python code to count the gaps and visualize the dates of gaps in order to see for any huge gap that would be problematic for analyzing data.

Figure 1: Missing Dates in Full Date Range (2010 to 2011)

We count only 9 days without data over the 25-year range. Thus, the full data contains at least 25 years of values

## 3 First Results

### 3.1 Prices Evolutions

Then, plotting the prices evolution:

Figure 2: Prices over time by frequency

## 3.2 Calculating Returns

Figure 3: Prices, returns and log returns

## 3.3 Squared Returns

Figure 4: Squared daily returns and daily log returns

# 4 Amazon and the 8 Stylized Facts

## 4.1 Prices are non-stationary

The first feature that will highlight non-stationarity of the prices is the comparison of  $p(t)$  vs  $p(t - 1)$ .

Figure 5: Comparison of  $\log(p_t)$  vs  $\log(p_{t-1})$

Indeed, The graph demonstrates a strong linear relationship between  $\log(p_t)$  and  $\log(p_{t-1})$ , indicating that Amazon's prices exhibit non-stationarity, as the prices at time  $t$  are highly dependent on those at  $t - 1$ . Moreover, the next graph proves that Amazon's empirical ACF is slowly decaying which is often a symptom on non-stationarity.

Figure 6: Autocorrelations of daily Prices (1999-2024)

## A Appendix: Python Code

Below is the Python code used in this analysis.

```

1  # Python code example
2  import numpy as np
3  import pandas as pd
4
5  def analyze_data(data):
6      mean = np.mean(data)
7      std_dev = np.std(data)
8      return mean, std_dev
9
10 data = [1, 2, 3, 4, 5]

```

```
11 mean, std_dev = analyze_data(data)
12 print(f"Mean: {mean}, Standard Deviation: {std_dev}")
```
